IDEXX REFERENCE LABORATORIES Colilert Test (100- test pack)

Supplier: IDEXX REFERENCE LABORATORIES
982716300

encompass

The Colilert test simultaneously detects or quantifies both total coliforms and Escherichia coli, with results in 24 hours. The Colilert Test uses proprietary Defined Substrate Technology (DST) to simultaneously detect total coliforms and E. coli. Two nutrient-indicators, ONPG and MUG, are the major sources of carbon in Colilert and can be metabolized by the coliform enzyme -galactosidase and the E. coli enzyme -glucuronidase, respectively. **This item is only able to be ordered if customer is a pharmaceutical or manufacturing entity.**

**Enzo Life Sciences Microcystins
(Adda specific) ELISA kit
(1x96wells)**

⚡

Supplier: Enzo Life Sciences ALX850319K101

encompass
preferred

Patented ELISA for rapid detection of microcystins and nodularins. Polyclonal antibody prepared against the Adda moiety binds to microcystins and nodularins, allowing the congener-independent determination of these toxins and many of its congeners, and does not cross-react with other non-related toxins or compounds. No pre-sample preparation required. Total time for measurement is less than 2.5 hours. Enables simultaneous measurement of multiple samples at reasonable costs. Sensitivity: 0.1ng/ml (range 0.15 to 5ng/ml). Assay Time: 1 hour 90 minutes. Applications: ELISA

Description

Differentiate members of the family Enterobacteriaceae based on the utilization of citrate with this medium.

Differentiate members of the family Enterobacteriaceae based on the utilization of citrate with Thermo Scientific™ Oxoid™ Simmons Citrate Agar (Dehydrated). The medium is a solidified form of Koser citrate medium which suffered from the disadvantage that false appearance of growth occurred when large inocula were employed. Simmons¹ modified Koser's formulation by adding agar and bromothymol blue². It complies with the recommendations of the APHA³.

Simmons Citrate Agar is used with as slopes in test tubes or as a plate medium in petri dishes. Positive growth (i.e. citrate utilization) produces an alkaline reaction and changes the colour of the medium from green to bright blue, while in a negative test (i.e. no citrate utilization) the colour of the medium remains unchanged.

Escherichia coli including serotypes from epidemic infantile enteritis, as well as *Shigella*, *Yersinia* and *Edwardsiella* species do not grow on the medium. *Serratia* and the majority of the *Enterobacter*, *Citrobacter*, *Klebsiella*, *Proteus* and *Providencia* species, except *Morganella morganii* and *Klebsiella rhinoscleromatis* utilize citrate and produce the characteristic blue coloration⁴.

Simmons Citrate Agar may be used to differentiate citrate-positive *Salmonella enteritidis* and members of *Salmonella* subgenus II, III and IV from the citrate-negative *Salmonella typhi*, *Salmonella paratyphi A*, *Salmonella pullorum* and *Salmonella gallinarum*.

Not all products are available for sale in all territories. Please inquire.

Remel™ and Oxoid™ products are now part of the Thermo Scientific brand.

NEOGEN SIM Medium, 500 g

✳

Supplier: NEOGEN 700003636

encompass
performed

SIM Medium is used for the differentiation of microorganisms on the basis of hydrogen sulfide production, indole production, and motility in a laboratory setting. SIM Medium is not intended for use in the diagnosis of disease or other conditions in humans. Semisolid media have been used extensively in the determination of bacterial motility. The production of hydrogen sulfide, indole formation, and motility are useful diagnostic tests in the identification of Enterobacteriaceae, especially Salmonella spp. and Shigella spp. In 1940, Sulkin and Willett demonstrated motility, hydrogen sulfide production, and carbohydrate fermentation by members of Salmonella and Shigella groups. They called attention to the "brush-like growth" or motility of the typhoid organisms. Graene et al. used SIM Medium to detect motility in a large series of cultures of typhoid organisms. For more information visit <https://www.neogen.com/solutions/Microbiology/sim-medium>

item 34

Description

CAS: 7439-89-6 | Fe | 55.85 g/mol

This Thermo Scientific Chemicals brand product was originally part of the Acros Organics product portfolio. Some documentation and label information may refer to the legacy brand. The original Acros Organics product / item code or SKU reference has not changed as a part of the brand transition to Thermo Scientific Chemicals.

For atomic adsorption spectroscopy

Specifications

Chemical Name or Material	Iron standard solution
Name Note	1 mg/ml Fe in 2% HNO3
Packaging	Plastic bottle
CAS	7439-89-6, 7697-37-2, 7732-18-5
Density	7.86
Physical Form	Liquid
Molecular Formula	Fe
Concentration	997 to 1003 µg/mL of Fe (3+) in 2% HNO3 (20°C)
MDL Number	MFC00010999

Description

Test the ability of the organism to produce and maintain stable end products from glucose fermentation using Methyl Red Reagent.

Test the ability of an organism to produce and maintain stable end products from glucose fermentation using Thermo Scientific™ Remel™ Methyl Red Reagent. In 1915, Clarke and Lubs first described the methyl red test using it to differentiate between the coli-aerogenes group of enteric bacteria¹.

The methyl red (MR) test uses methyl red as an indicator to determine the pH of the medium when an organism ferments glucose². All members of Enterobacteriaceae are, by definition, glucose fermenters and produce acidic by-products. Ready to Use: convenience of a prepared reagent. Easy to interpret: Positive Test - red color development on the surface of the medium Negative Test - yellow color on the surface of the medium. Following initial incubation, all Enterobacteriaceae give a positive methyl red reaction if tested³. However, on further incubation (2-5 days) MR – positive organisms continue producing acids overcoming the phosphate buffer resulting in a low pH and a red color development. MR-negative organisms further metabolize the initial fermentation products by decarboxylation to produce neutral acetyl methyl carbinol (acetoin), which results in a neutral pH and no red color. The methyl red reagent contains 0.2 g methyl red indicator dissolved in 600 mL ethyl alcohol and 400 mL demineralized water supplied as 25 mL bottles. Not all products are available for sale in all territories. Please inquire. Remel™ and Oxoid™ products are now part of the Thermo Scientific brand.

Specifications

CAS	7447-40-7
Linear Formula	KCl
Concentration	0.1 M KCl
MDL Number	MFCD00011360
Quantity	250 mL
Formula Weight	74.55

Pack Size: 1 kit (~100 tests)

Hazard Class /UN Number: Not Restricted

Storage Temp: Room Temperature

Colorimetric test kit for the determination of Cyanide in water samples. VISOCOLOR ECO Cyanide combines easy performance with high measurement safety, by color and turbidity compensation. For visual determination by comparison with a color chart or photometric measurement with our compact photometers.

Gradation: 0 · 0.01 · 0.02 · 0.03 · 0.05 · 0.07 · 0.10 · 0.15 · 0.20 mg/L CN⁻

Evaluable on: Advance, PF-3 Fish, PF-12Plus, Visual

Test No.: 5-22

Method: Cyanide - Barbituric acid/Pyridine

Sea water analysis: Yes

Storage temperature: 15-25 °C / 59-77 °F

Shelf life (from production): 1 Year(s)

Scope of delivery: Reagents for 100 tests, color chart and accessories in a box

Gross weight (incl. packaging): 245.51 g / 0.54 lbs

Packaging dimensions: 170 x 125 x 48 mm / 6.69 x 4.92 x 1.89 Inch

Hazardous material: Yes
